

## SMART-CONTROL – SMARTLY IMPLEMENTED

Thanks to the software Smart-Control developed by the Spline team, planning and implementation are combined in one step. This innovative software integrates all the planning and implementation steps within a project – encompassing design, detailed planning and calculations up to and including quality control and documentation.

Smart-Control is perfectly coordinated with the combination of intelligent parameter software and compatible hardware. This means that interface problems between planning and execution are successfully avoided.

The software creates the corresponding wiring diagrams, parts and order lists, calculations and even the documentation for the button configurations once work has concluded and does so independently and automatically.

On the one hand, it is a perfect tool for planning and implementation and furthermore, allows the simple programming of processes and requirements – which are sometimes complex – in the area of home automation.

The bus/conductor system for peripheral devices such as for example light and blind switches is planned and configured directly on each of the floor plans after they have been input by simply using Drag & Drop.

## SCENES CREATE AMBIENCE

With Smart-Control, it is possible to define lighting scenes that match situations and moods and which are also adapted to different rooms and zones. This is done by combining several rooms in a "zone". Different scenes can be configured for each room or zone. "Evening", "Home cinema", "Party", etc. are possible scene descriptions for the "Living area" zone. Apart from lighting, the shadowing equipment and the background music can be defined within scenes thus creating room ambiances that are adapted to every situation.

From infrared buttons and remote control units to touch panels, Smart-Control, in combination with the AMX controller, integrates widely differing control elements.

## EXPANDABLE AND FLEXIBLE

The needs of the occupants of a house can change quickly. A new home cinema system, a modern Multiroom Entertainment Centre, an expanded wellness area or a new video surveillance system – Smart-Control can be expanded and extended at any time, virtually without restrictions.

Smart-Control is the perfect match for the combination of intelligent parameter software and compatible hardware. It is based on innovative technology and simplifies individual planning and even the networking of modern and complex peripheral devices. This means that interface problems between planning and execution can be successfully avoided.

Thanks to Smart-Control, a client's wishes can be fulfilled quickly and flexibly at little expense, which at the end of the day helps to keep costs in check.
